Video Editing Desk Setup |

Combining both “industrial” and “retro” styles into a minimalist, functional design for a video editing station.

—> chose the main desk as a “Bora Centipede” workbench because of sturdiness, also folding for people who constantly move around (like me)

- wanted enough space for the peripherals, wanted it to feel inspirational as well
- Wanted it to be tall enough to sit for the chair of choice :) (see later)

- re-used some extra foam floor tiles on the wall to feel like sound-proofing

—> another look @ the desk setup, have a monitor, laptop, keyboard, external 6TB hard-disk for video storage, and a snazzy chalk board next to the whole thing :)

Other things we wanted

- a nice monitor that wasn't too expensive but was good for editing
- Pair of headphones for editing
- Keyboard and peripherals that help but, again, not too expensive

Chose a pair of M&D MH40 headphones mostly for their great retro look, chose the monitor as an ASUS ProArt 27 but the cheap edition which has great color accuracy but is only ~250 dollars, we added a loupdeck and a craft keyboard so no need for panels.

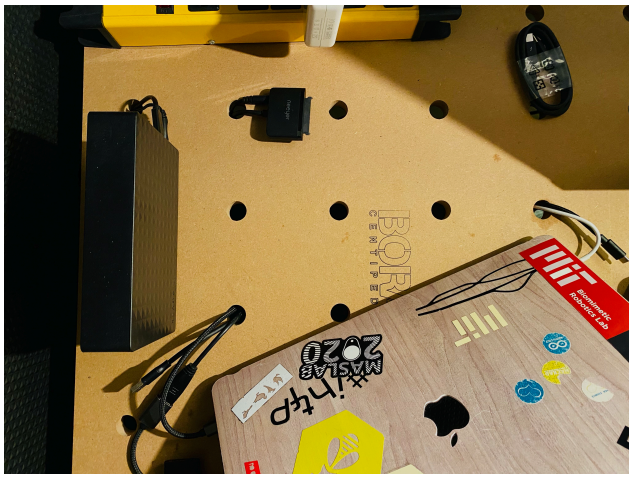
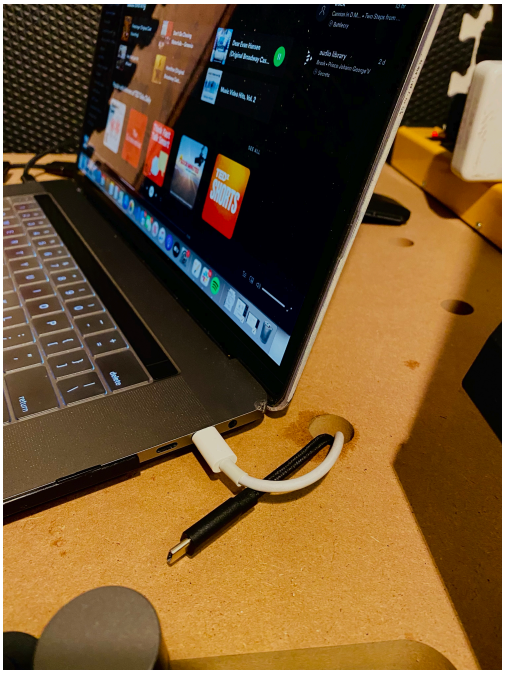
Loupedeck



—> lightbulb hanging lamp for, again a retro but industrial feel

—> holes in the desk make for perfect cable routing



—> more images of the cable routing, I really like it it keeps everything neat

—> and it just wouldn’t be complete without a director’s chair :)
